

Chime • Software Engineer

AI App Experience

Mar 2025 - Present

- Defining agentic LLM harnesses, loops, and skills over Anthropic models with Python LangChain SDK over FastAPI to power net-new capabilities for over 10 million Chime members
- Designed a patent-filed transaction categorization async pipeline (SNS, SQS, SageMaker) with self-healing user-driven agentic loop
- Led the implementation, rollout, and launch to GA of the categorization pipeline, reducing uncategorizable transactions ("Other" category) by over 30%
- Independently designed a novel recurring transaction and subscription detection and classification system, improving the quality of Chime's in-house subscription (metrics pending - launch in progress)
- Leading subscription management & aggregations product across the agent platform, contributing to over 7+ repositories from React Native to the ETL pipelines enabling offline data analytics workstreams
- Implementing offline and online evaluation frameworks with 90%+ consistency in a highly compliant environment

Transactions Intelligence Platform

- Designed and implemented a cross-service bills and recurring expense cache mechanism backed DynamoDB table, reducing average latency on a core API by 68%
- Built cross-service idempotency solution during critical infrastructure migration, enabling idempotency guarantees for more than 5 services during a 25 million account 3+ month migration period
- Independently drove and implemented a buffer mechanism that resulted in \$350k annualized savings
- Collaboratively brought new internal support portal to feature parity with legacy solution, including unblocking new stop payments mechanism for support agents handling over 10k cases/day
- Acted as Sev2 incident commander including holding thoughtful and informative retro

Coinbase • Software Engineer

Coinbase Developer Platform

May 2022 - Apr 2024

- Implemented (0-1 including TDD, infra & ci/cd) Golang service exposing REST with gRPC gateway sidecar and backed by MongoDB, powering the coinbase developer portal: cdp.coinbase.com
- Decomposed monolithic business logic, including sensitive resources (Ethereum nodes) and leading a tightly coupled front-end migration by establishing write & read migration phases
- Leveraged SpiceDB-based permission logic for IAM and authored a 10+ page technical spec detailing migration, API design, and infrastructure configurations with rationale (EC2, Docker, Kubernetes)
- Solved novel transient retry auth errors with Redis locking mechanism for idempotency

Blockchain Interoperability Platform

- Built Temporal workflows to ensure reliable processing of high-volume (over \$100m) crypto transfers across high TVL networks like Polygon, Avalanche, and Base
- Enhanced system observability with Datadog and Bugsnag, and improved CI/CD pipelines via Buildkite and Testify, achieving >99% unit test coverage.
- Devised logic which increased Coinbase cross-chain liquidity offerings while programmatically keeping hot reserves below threshold, greatly enhancing user experience

Tech Stack

Ruby/Twirp API • Python/FastAPI • Go • EC2 • DynamoDB • SQS/SNS K8s • Docker • PostgreSQL • SQL • Sidekiq • Redis • Protobufs OpenSearch (ElasticSearch) • Kinesis • Snowflake • React Native LangChain & Deep Agents • LangSmith • Claude Code • Datadog

Education

B.S. Computer Science,
Cal State, Long Beach
Class of 2022
